

Chapter -10
Motion and measurement of Distances

NOTES:

- Different modes of transport are used to go from one place to another.
- In ancient times, people used body parts as different units of measurements.
- The system of units we now use is known as International System of Units (SI units).
- The different types of motion are rectilinear motion, circular motion and periodic motion.
- The motion of an object in a straight line is called rectilinear motion.
- The motion of an object in a circular path is called circular motion.
- The motion of an object that repeats itself after some period of time is called periodic motion
